

Blocker Re-Audit: Prior Findings Mapped Against the Current Codebase

Date:	June 16, 2026
Scope:	Re-audit of the prior "NOT READY" findings against current code + production DB
Target Broker:	Upstox Live V3 Gateway (Nifty/BankNifty Options)
Verdict:	ALL PRIOR BLOCKERS RESOLVED IN CODE — remaining gate is empirical, not structural
Remaining Gate:	Live path is code-complete + unit-tested but never exercised; needs a supervised 1-lot pilot + track record

Why this re-audit exists:

An earlier audit verdicted the platform "NOT READY FOR LIVE MONEY" on the basis of a fixed blocker checklist (empty trade ledger, exits only via polling, static delta deadlock, stale-signal entries, no reconciler, no cost model). Each of those items has since been addressed in code — primarily by the audit-fix campaign (Stages A–D, 2026-06-12) and the live-readiness fixes in commit b38e5c0 (TASK-021, 2026-06-15). This document re-checks every prior claim against the live code path and the production database so the readiness picture is accurate.

Corrected verdict: The structural blockers are **closed**. The honest reason live trading is not yet "on" is that the live execution path has **never been exercised with real capital** (CORE_ENGINE_LIVE_ENABLED=false by design) and there is **no live track record yet**. The next step is a small, supervised live pilot — a founder decision — not

another round of bug fixing.

1. Verification Evidence (Production DB)

The prior audit's headline claim was a blank account ledger. Direct counts from the production quantg database refute this. Source: *fallback snapshot (VPS, 2026-06-16)*.

Collection / Metric	Prior Audit Claim	Actual (Production)
trade_fills	"remains empty"	77 fills (77 paper / 0 live)
trades	"remains empty"	38 trades
orders	—	82 orders
strategy_positions (closed)	—	38 closed positions with realized P&L
strategies	—	96 total, 0 armed right now

The ledger is populated. Live fills route through the same `_book_live_fill_from_order` → `PortfolioLedger.process_fill` path (`server.py`) that already writes these paper fills, with unit coverage in `tests/test_audit_fixes.py`. `live_fills` = 0 only because the live engine has never been switched on.

2. Prior Blockers — Current Status

Each defect from the original audit, its current state in code, and any residual risk that remains.

Prior Blocker	Current State in Code	Residual Risk
Zero-ledger blindness (no trade audit trail)	RESOLVED. Both paper and live fills route through PortfolioLedger.process_fill → trade_fills/trades. Verified: 77 fills / 38 trades in prod.	Low. Live path shares the verified code but is unexercised.
Exits only via polling (no broker-side stop)	RESOLVED. _place_resting_sl_order submits an SL order to Upstox right after the entry fill (server.py ~16268); place_gtt_order exists in the gateway. The 5s poll is now a backstop, not the only line of defense.	Medium. Resting-SL placement has unit tests but zero live executions — must be watched on the first live fills.
Static delta cap (50) deadlock	RESOLVED. Delta exposure cap is config-driven (RISK.DELTA_CAP, default 500) and the check in risk_manager.py is no longer a hard static 50.	Low. Tune DELTA_CAP to live account size before scaling strategies.
Stale-signal entries (20-bar-old setups)	RESOLVED. strategy_runner.py rejects signals older than LIVE_CANDLE_MAX_AGE (default 1200s = 20 min).	Low–Med. 20 min is looser than the 10-min guideline for weekly options; consider tightening per-strategy.
No open-position reconciler	RESOLVED. position_reconciler.py compares broker vs strategy_positions and blocks on mismatch (live-mode only).	Medium. Reconciler logic is untested against a real Upstox account — validate during the pilot.
No slippage / cost model (0% slippage)	RESOLVED. execution_router.py applies slippage (5 bps), partial fills, stale-quote rejection, and the full F&O cost stack (brokerage, STT, exch txn, SEBI, stamp, GST).	Medium. 5 bps flat is optimistic for weekly-options market orders — raise for conservative paper realism.
LTP feed fallback / P&L freeze	MITIGATED. A WS drop still freezes displayed P&L, but the position is now protected by the broker-side resting SL rather than riding naked.	Low–Med. Add a feed-staleness alert so a frozen P&L is visibly flagged, not silent.

Net: all six structural blockers are resolved or mitigated in code. The residuals are about *exercising and calibrating* the live path — not building it.

3. The True Remaining Gate to Live

Because the structural work is done, what stands between QuantG and live capital is empirical and operational, not architectural:

Remaining Item	What's Needed	Type
1. Exercise the live path	Founder flips CORE_ENGINE_LIVE_ENABLED=true and runs a supervised 1-lot pilot. Confirm: a resting SL appears in the Upstox terminal on entry, live fills write to trade_fills, and the reconciler stays clean.	Empirical
2. Build a track record	Accumulate verified live P&L toward the Phase-1 targets (3–5%/mo, Sharpe > 1.5, max DD < 20%, win rate > 55%). This is the real fundraising asset.	Time / Data
3. Calibrate slippage	Raise PAPER_SLIPPAGE_PCT above 5 bps for weekly options so paper metrics don't overstate net returns vs. live.	Tuning
4. Tighten stale-signal window	Consider lowering STRATEGY_LIVE_CANDLE_MAX_AGE_SEC from 1200s toward ~600s for fast option strategies.	Tuning
5. Feed-staleness alert	Surface a visible warning when the WS feed is stale so a frozen P&L is never mistaken for a flat position.	Observability

4. Recommended Live Pilot (Unchanged — Still Sound)

When the founder chooses to go live, the conservative rollout from the original audit still applies:

- Scale-down capital:** one lot on a single index strategy (e.g. NIFTY ATM momentum buyer). Restrict live capital to ~₹25,000.
- Manual supervision:** watch the terminal 9:15 AM–3:30 PM for the first 3 sessions; confirm resting SLs and live ledger writes on the first real fills.
- Aggressive circuit breakers:** tight daily loss limit (e.g. ₹1,000) and verify the global kill switch.

Note: enabling live trading is a founder decision and is deliberately not performed by AI agents.
